

Border crossing

Part of operating border crossing is to provide secure process that will ensure safety as well as security and on the other hand will allow fast and convince (as much it can) process to the passengers and operating team.

When security state forced to confirm that passengers as well as their luggage will be checked in the fastest and most secured process that where human regulation and technology join hands.

The said border crossing require demanding security and at the same time not to make the border crossing too hard.

Passengers and luggage are been send to different directions. Both are been checked to confirm that no dangerous materials will be entered. The RFID system supports the luggage security process. The luggage items are been send along lane of security system to be checked. The luggage items are been identified by its RFID tags. That gives the controls that monitor the process to send the luggage items either as OK and can be return to the passenger or as require more detailed examination.

In both cases, it's an automatic process with no human involve.

The ability to run automatic identification process makes it faster and safer.

Galbital RFID Solutions developed and implemented this luggage control system that allows the security inspectors the ability to run full automated process.

Galbital's system is the long arms of the security inspectors when execute the supervisors decisions into system activities.
